

# Conic Assignment

Gautam Singh

**Abstract**—This document contains the solution to Question 6 of Exercise 5 in Chapter 11 of the class 11 NCERT textbook.

- 1) Find the area of the triangle formed by the lines joining the vertex of the parabola

$$x^2 = 12y \quad (1)$$

to the ends of its latus rectum.

**Solution:** Rewriting (1) in matrix form,

$$\mathbf{x}^T \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} \mathbf{x} + 2 \begin{pmatrix} 0 & -6 \end{pmatrix} \mathbf{x} = 0 \quad (2)$$

Since the parabola is clearly symmetric about the  $y$ -axis, we see that the directrix is parallel to the  $x$ -axis, thus

$$\mathbf{n} = \begin{pmatrix} 0 \\ 1 \end{pmatrix} \quad (3)$$

Using the standard definition of the conic and equating  $\mathbf{u}$  and  $f$ ,

$$\begin{pmatrix} 0 \\ -6 \end{pmatrix} = c \begin{pmatrix} 0 \\ 1 \end{pmatrix} - \mathbf{F} \quad (4)$$

$$0 = \|\mathbf{F}\|^2 - c^2 \quad (5)$$

From (4), we have

$$\mathbf{F} = \begin{pmatrix} 0 \\ c + 6 \end{pmatrix} \quad (6)$$

Using (6) in (5),

$$(c + 6)^2 = c^2 \quad (7)$$

$$\implies c = -3 \quad (8)$$

Thus,

$$\mathbf{F} = \begin{pmatrix} 0 \\ 3 \end{pmatrix} \quad (9)$$

The latus rectum of the parabola is the chord passing through the focus parallel to the directrix. Its equation is given by

$$\begin{pmatrix} 0 & 1 \end{pmatrix} \mathbf{x} = \begin{pmatrix} 0 & 1 \end{pmatrix} \begin{pmatrix} 0 \\ 3 \end{pmatrix} = 3 \quad (10)$$

Adding (2) to 12 times (10),

$$\mathbf{x}^T \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} \mathbf{x} = 36 \quad (11)$$

From (11) and (10), the ends of the latus rectum are given by

$$\mathbf{x} = \begin{pmatrix} \pm 6 \\ 3 \end{pmatrix} \quad (12)$$

Since the vertex of the parabola is at  $\mathbf{P} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$ , we see that the area of the required triangle is

$$A = \frac{1}{2} \begin{vmatrix} 6 & 3 \\ -6 & 3 \end{vmatrix} = 18 \text{ sq. units} \quad (13)$$

The situation is illustrated in Fig. 1, plotted using the Python code `codes/parabola.py`.
