

# Optimization Assignment

Gautam Singh

**Abstract**—This document contains the solution to Question 4 of Exercise 2 in Chapter 10 of the class 11 NCERT textbook.

- 1) Find the coordinates of the foot of perpendicular from the point

$$\mathbf{P} = \begin{pmatrix} -1 \\ 3 \end{pmatrix} \quad (1)$$

to the line

$$(3 \ -4)\mathbf{x} = 16 \quad (2)$$

**Solution:** Any point on (2) is clearly of the form

$$\mathbf{Q} = \mathbf{A} + \lambda \mathbf{m} \quad (3)$$

where  $\lambda \in \mathbb{R}$  and

$$\mathbf{A} = \begin{pmatrix} 0 \\ -4 \end{pmatrix}, \quad \mathbf{m} = \begin{pmatrix} 4 \\ 3 \end{pmatrix} \quad (4)$$

Thus,

$$\|\mathbf{Q} - \mathbf{P}\|^2 = \|\mathbf{A} - \mathbf{P} + \lambda \mathbf{m}\|^2 \quad (5)$$

$$= \left\| \begin{pmatrix} 4\lambda + 1 \\ 3\lambda - 7 \end{pmatrix} \right\|^2 \quad (6)$$

$$= 25\lambda^2 - 34\lambda + 50 = f(\lambda) \quad (7)$$

Since the coefficient of  $\lambda^2$  in  $f(\lambda)$  is positive, it follows that  $f(\lambda)$  is convex. Hence, the minima is achieved at

$$f'(\lambda_m) = 50\lambda_m - 34 = 0 \quad (8)$$

$$\Rightarrow \lambda_m = \frac{17}{25} \quad (9)$$

Thus, substituting into (3), we get

$$\mathbf{Q}_m = \frac{1}{25} \begin{pmatrix} 68 \\ -49 \end{pmatrix} \quad (10)$$

The value of  $\lambda_m$  is verified in Fig. 1, plotted by the Python code `codes/convex.py`.

Fig. 1: This convex function achieves its minimum at  $\lambda_m$ .
